Activity: Hands-On-Activity_8.1

Name: Quibral, Juliann Vincent B.

Section: BSCPE22S3

1. With the earthquakes.csv file, select all the earthquakes in Japan with a magType of mb and a magnitude of 4.9 or greater.

```
1 import pandas as pd
2
3 df = pd.read csv("earthquakes.csv")
4
5 japan_earthquakes = df[(df['parsed_place'] == 'Japan') & (df['magType'] == 'mb') & (df['mag'] >= 4.9)]
6
7 print(japan_earthquakes)
8
                              time
                                                         place tsunami

2. Create bins for each full number of magnitude (for example, the first bin is 0-1, the second is 1-2, and so on) with a magType of ml and count how many are in each bin.

```
1 import pandas as pd
 2
 3
 4 df = pd.read_csv("earthquakes.csv")
 6 # Filter earthquakes with magType 'ml'
 7 ml_earthquakes = df[df['magType'] == 'ml']
9 # Create bins for each full number of magnitude
10 bins = [i for i in range(11)]
12 # Count earthquakes in each bin
13 magnitude_counts = pd.cut(ml_earthquakes['mag'], bins=bins, right=False).value_counts().sort_index()
15 print(magnitude_counts)
16
     [0, 1)
                2072

```

- 3. Using the faang.csv file, group by the ticker and resample to monthly frequency. Make the following aggregations:
- Mean of the opening price
- Maximum of the high price
- Minimum of the low price
- · Mean of the closing price
- Sum of the volume traded

6

8

10

12

```
1 import pandas as pd
3 df = pd.read_csv("faang.csv", index_col='date', parse_dates=True) # Read the CSV file into a pandas DataFrame
5 monthly_aggregations = df.groupby('ticker').resample('M').agg({ # resample to monthly frequency
       'open': 'mean',
       'high': 'max',
      'low': 'min',
      'close': 'mean',
       'volume': 'sum'
11 })
13 print(monthly_aggregations)

8. Add event descriptions:

- · Create a dataframe with the following three columns: ticker, date, and event. The columns should have the following values:
- ticker: 'FB
- date: ['2018-07-25', '2018-03-19', '2018-03-20']
- · event: ['Disappointing user growth announced after close.', 'Cambridge Analytica story', 'FTC investigation']
- Set the index to ['date', 'ticker']

[1255 rows x 6 columns]

· Merge this data with the FAANG data using an outer join

```
1 import pandas as pd
2
3 event_data = {
4
       'ticker': ['FB', 'FB', 'FB'],
       'date': ['2018-07-25', '2018-03-19', '2018-03-20'],
5
       'event': ['Disappointing user growth announced after close.', 'Cambridge Analytica story', 'FTC investigation']
 6
7 }
8 events df = pd.DataFrame(event data)
10 events_df['date'] = pd.to_datetime(events_df['date']) # Convert date column to datetime type
11
12 events_df.drop_duplicates(inplace=True) # Remove duplicates
13
14 events_df.set_index(['date', 'ticker'], inplace=True)
15
16 faang_df = pd.read_csv("faang.csv", parse_dates=['date'])# Read the FAANG data into a pandas DataFrame and reset index
17 faang_df.set_index(['date', 'ticker'], inplace=True)
18
19 merged_df = faang_df.merge(events_df, how='left', left_index=True, right_index=True) # Merge the event data with the FAANG data using a

9. Use the transform() method on the FAANG data to represent all the values in terms of the first date in the data. To do so, divide all the values for each ticker by the values for the first date in the data for that ticker. This is referred to as an index, and the data for the first date is the base (https://ec.europa.eu/eurostat/statistics-explained/ index.php/ Beginners:Statisticalconcept-Indexandbaseyear). When data is in this format, we can easily see growth over time. Hint: transform() can take a function name.

```
1 import pandas as pd
3 faang_df = pd.read_csv("faang.csv", parse_dates=['date'])
4
5 def calculate_index(x):
      return x / x.iloc[0]
6
8 indexed_faang_df = faang_df.groupby('ticker').transform(calculate_index) # Group the data by ticker and apply the custom function using tr
10 print(indexed_faang_df)
11
                        high
                                          close
              open
                                  low
